Difference between the MSSP edition and the Basic and Standard plans

Simplified log management across clients: Have the convenience of managing, monitoring, and delegating multiple clients from a single console. This streamlines your operations, saves time, and increases efficiency.

Extended log retention: The MSSP edition's log retention time is two times that of our Standard plan and three times that of our Basic plan. This ensures that you have access to critical log data for a longer duration, enabling better analysis and investigation.

Reduced credential management: Managing multiple clients brings scalability challenges. Eliminate the need to maintain multiple sets of credentials for each technician in your organization. With the MSSP edition, you only need a single set of credentials to access and manage all your clients, simplifying the process and reducing administrative overhead.

Client blocking and log preservation: The MSSP edition offers the flexibility to enable or disable clients during payment disputes. This functionality allows you to block incoming logs and server threads from clients with payment delays. Despite such restrictions, the system ensures the retention of their log data for compliance and audit purposes.

Dynamic license allocation: Be equipped to dynamically allocate licenses to clients based on their usage requirements. For example, if a client is not utilizing the storage as expected, you can easily reallocate it to another client. Use this flexibility to optimize your resources and reduce costs by paying only for what you actually use.

Access to MSSP features: Gain access to our upcoming MSSP features, such as a client login portal, personalization options, technician audit capabilities, and more, through our MSSP edition. These features will enhance your experience, provide additional value, and ensure cutting-edge security.

Expanded capacity: Get 100 alert profiles and 20 correlation rules for each client when you opt for the MSSP edition. This surpasses the capabilities of our Standard plan, which offers 50 alert profiles and 10 correlation rules. For enhanced comprehensive threat detection and response, fine-tune your security monitoring and detection for each client with this expanded capacity.

Here's when you should choose the MSSP edition over the Basic and Standard plans

Dedicated technician management: With dedicated technician assignment and management features, this edition allows RBAC, enabling MSSPs to assign technicians to specific clients for data privacy and operational efficiency.

Multi-tenancy requirements: Manage multiple customer profiles seamlessly from a centralized console. This edition ensures that each customer's data is logically separated, maintaining stringent data privacy and security.

Cost-efficiency: Optimize costs by leveraging our cloud-based model, which minimizes the need for substantial upfront investments in on-premises hardware and infrastructure. Additionally, this approach significantly reduces ongoing maintenance costs and the associated labor typically required for the upkeep of physical hardware and software systems.

Secure data handling: Benefit from strict data security, privacy, and segregation to protect sensitive information across multiple operations and clients.
